

Core Innovation Management

Tables :

- innovation
- innovation_history
- innovation_section
- innovation_section_history
- innovation_record_schema
- innovation_transfer

Explanation

This group represents the central `Innovation` entity.

- **Innovation Record:** `innovation` acts as the primary registry. The structure and data of an innovation are now primarily managed via `innovation_document` (JSON based), replacing many of the old relational tables.
- **Structure:** `innovation_section` defines sections of the innovation form.
- **Schema:** `innovation_record_schema` controls and enforces the structure of the JSON documents / form inputs.
- **History:** `innovation_history` tracks changes to the core record.

Innovation Assessment & Evidence

Tables :

- innovation_assessment
- innovation_assessment_history
- innovation_assessment_organisation_unit
- innovation_reassessment_request
- innovation_export_request
- innovation_document
- innovation_document_history
- innovation_document_draft
- innovation_file

Explanation

This group handles the core qualification of an innovation's value.

- **Assessment:** `innovation_assessment` stores results of evaluating an innovation.
- **Documents (Evidence):** The `innovation_document` table (and its draft/history) serves as the main repository for the detailed innovation record, effectively replacing legacy tables for evidence, benefits, and categorization.
- **Requests:** `innovation_reassessment_request` and `innovation_export_request` handle workflow requests related to the assessment status or data export.
- **Files:** `innovation_file` is the current standard for managing file attachments.

Innovation Support & Workflow

Tables :

- `innovation_support`
- `innovation_support_history`
- `innovation_support_user`
- `innovation_support_log`
- `innovation_support_log_organisation_unit`
- `innovation_task`
- `innovation_task_history`
- `innovation_task_message`
- `activity_log`
- `innovation_thread`
- `innovation_thread_message`
- `innovation_thread_follower`
- `innovation_thread_follower_history`
- `innovation_share`
- `innovation_share_log`
- `innovation_survey`

Explanation

This group manages the support lifecycle and actionable workflow items.

- **Innovation Support:** `innovation_support` tracks support instances provided by organisation units.

- **Tasks:** `innovation_task` represents the current standard for actionable items (replacing `innovation_action`).
- **Communication:** Threaded discussions and activity logs support the workflow.
- **Feedback:** `innovation_survey` captures user feedback, particularly at the end of a support lifecycle (e.g., Support Satisfaction).
- **Sharing:** `innovation_share` manages sharing an innovation with broader organisations, allowing visibility/collaboration.

User & Organisation Management

Tables :

- `user`
- `user_role`
- `user_role_history`
- `user_strategic_role`
- `user_preference`
- `organisation`
- `organisation_unit`
- `terms_of_use`
- `terms_of_use_user`
- `audit`

Explanation

This group manages the actors in the system.

- **Users & Roles:** `user` and `user_role` correspond to the modern RBAC system with roles such as `ADMIN`, `INNOVATOR`, `ACCESSOR`, `ASSESSMENT`, and `QUALIFYING_ACCESSOR`. `user_role` replaces the legacy direct mappings like `organisation_user`.
- **Organisations:** `organisation` and `organisation_unit` define the hierarchy of NHS bodies and other entities.
- **Compliance:** `terms_of_use` and `terms_of_use_user` track user agreements. `audit` provides a generic audit trail of user actions across the system.

Notifications & Announcements

Tables :

- notification
- notification_user
- notification_schedule
- notification_preference
- announcement
- announcement_user
- notify_me_subscription

Explanation

This group handles all system communications.

- **Notifications:** Centralized notification system (`notification` , `notification_preference` , etc.).
- **Announcements:** Broadcast messages to users.
- **Subscriptions:** `notify_me_subscription` allows users to subscribe to specific updates.

Legacy & Outdated Schema

Tables :

- comment
- comment_history
- innovation_action
- innovation_action_history
- innovation_area
- innovation_area_history
- innovation_care_setting
- innovation_care_setting_history
- innovation_category
- innovation_category_history
- innovation_clinical_area
- innovation_clinical_area_history
- innovation_collaborator
- innovation_collaborator_history
- innovation_deployment_plan
- innovation_deployment_plan_history
- innovation_disease_condition
- innovation_disease_condition_history
- innovation_environmental_benefit

- innovation_environmental_benefit_history
- innovation_evidence
- innovation_evidence_file
- innovation_evidence_history
- innovation_file_legacy
- innovation_general_benefit
- innovation_general_benefit_history
- innovation_patients_citizens_benefit
- innovation_patients_citizens_benefit_history
- innovation_revenue
- innovation_revenue_history
- innovation_section_file
- innovation_standard
- innovation_standard_history
- innovation_subgroup
- innovation_subgroup_benefit
- innovation_subgroup_benefit_history
- innovation_subgroup_history
- innovation_support_type
- innovation_support_type_history
- innovation_user_test
- innovation_user_test_history
- organisation_user
- organisation_unit_user
- typeorm_metadata
- analytics_organisation_inactivity_breach
- Migrations
- Seeds
- job_tracker

Explanation

These tables are considered deprecated or legacy.

- **Transitional Data:** Many `innovation_*` tables (e.g., `innovation_clinical_area`, `innovation_evidence`) have been superseded by the JSON-based `innovation_document` structure or new file management (`innovation_file`).
- **Legacy Roles:** `organisation_user` and `organisation_unit_user` are replaced by `user_role`.
- **Legacy Workflow:** `innovation_action` is replaced by `innovation_task`. `comment` is replaced by the threaded messaging system (`innovation_thread`).

- **System:** `typeorm_metadata` , `Migrations` , `Seeds` , `job_tracker` are system/tooling tables not part of the business domain.

Appendix: Temporal History Tables

You will notice that many tables have a corresponding `_history` table (e.g., `innovation` -> `innovation_history`).

These tables are part of a **System-Versioned Temporal Table** pattern (implemented via SQL Server Temporal Tables).

- **Purpose:** They automatically store the full history of every record. Whenever a record in the main table is updated or deleted, the old version is preserved in the `_history` table.
- **Usage:** This allows for complete audit trails, "time-travel" querying (viewing the state of data at any past point in time), and compliance with strict NHS data governance and audit requirements.
- **Structure:** History tables typically mirror the columns of the main table but include validity periods (`valid_from` , `valid_to`) to mark the lifespan of each row version.
